

Claims:

1. An apparatus for orientating a work tool, the apparatus comprising an anchor, an energy unit, a programmable controller, an axial displacement part and a rotational part, at least one of the axial displacement part and the rotational part being controllable by the programmable controller so that the work tool can be steered along any path within a work area.
2. An apparatus as claimed in claim 1, wherein the axial displacement part comprises a telescopic member.
3. An apparatus as claimed in claim 2, wherein the relative position of the telescopic member is transmittable to the controller by means of a position transmitter.
4. An apparatus as claimed in claim 1, wherein the relative position of the rotational part is transmittable to the controller by means of an angle transmitter.
5. An apparatus as claimed in claim 1, further comprising a second anchor, the axial displacement part being located between the first anchor and the second anchor.
6. An apparatus as claimed in claim 1, further comprising a work tool operably coupled to the axial displacement part or rotational part.
7. An apparatus as claimed in claim 6, wherein the work tool is a cutting tool.

PATENT

Attorney Docket No.: MRKS/0130

Express Mail No.: EV351032133US

8. An apparatus as claimed in claim 7, wherein the cutting tool is a high pressure water cutter.

9. A method of orientating a work tool in a wellbore, comprising:

setting an anchor in the wellbore; and

directing the work tool with an axial displacement part and a rotational part operably connected to the anchor;

wherein at least one of the axial displacement part and rotational part are controlled by a programmable controller.
